Kim Nejudne

SENIOR FULL-STACK ENGINEER

Senior full-stack engineer who ships whole products. Nine years of production JavaScript (React, TypeScript, Node), Python for the automation and AI work, and a decade in desktop publishing and magazine design before any of it, which is where the designer's eye came from. I build the whole thing: interface, motion, API, schema, pipeline, and the box it runs on.

Four products currently shipped and running at **kimnejudne.dev**: four distinct art directions, a written case study each, public source for all four.

EXPERIENCE

Full Stack Engineer, D-Launch

April 2026 – Present

- Built the automation pipeline behind a fully automated newsletter site for the streaming industry, from source collection through to a published issue
- Python scrapers gathering the sources, orchestrated as n8n workflows
- AI integrations drafting, classifying and summarising each issue, no editor in the loop

Contract Full Stack Engineer, NETINT Technologies

April – October 2026

- Built a proof of concept for offering NETINT's video processing units as a cloud service
- Maintained and extended netint.com, the company's WordPress site

Full Stack Engineer, Xergy

June 2025 – March 2026

- Built and shipped six modules for the ERP running a wholesale distributor's core operations, front to back in React and NestJS
- Worked directly with the operations and finance teams who used the system, turning operational requirements into software rather than taking tickets from a spec
- Cut a two-day manual month-end reconciliation to a report that runs in under an hour

Frontend Engineer, Fabletics

June 2023 – March 2025

- Shipped features to a high-traffic e-commerce storefront serving thousands of daily visitors, on a regular release cadence with designers, PMs and backend engineers
- Cut largest contentful paint on the product listing page by giving the lead product image priority and correct sizing, and removing a client-side data waterfall ahead of first render
- Set the review, performance and component standards the frontend was held to in an org of 15+, and wrote the onboarding new joiners came up through, in React and Redux

Full Stack Engineer, 10x Ventures

September 2021 – June 2023

- Built the MVP for a social platform for people building in public, end to end
- Designed the database schema and the backend APIs (NodeJS, Express); built the React/Redux frontend against them

EARLIER

Backend Developer, Tawk.to Inc. March – September 2021

NodeJS, MongoDB, Elasticsearch. Microservices depended on by 70+ systems.

Frontend Developer, Acudeen Technologies Inc. May 2019 – March 2021

React, Redux, Sass, Bootstrap. Small team, fast release cadence.

Freelance Web Developer June 2016 – March 2019

React, Redux, NodeJS, Express, MongoDB, Firebase. Owned end to end.

SELECTED WORK

POKÉTRACK. Project tracking that levels up. A partner's entire state (species, level, evolution) is derived from the sum of its XP events and never stored, so undoing work de-evolves it for free.

React · FastAPI · MongoDB · real PokéAPI growth curves — poketrack.kimnejudne.dev

TS-DOJO. A TypeScript course graded by the real compiler. TypeScript 6 runs in a Web Worker for live diagnostics and inferred types, every exercise passes or fails by the compiler and its tests, and the REPL is driven by Vim keys. No backend; it works offline.

Vite · React · TypeScript 6 · CodeMirror 6 · Web Workers — dojo.kimnejudne.dev

BUZZR. A game-show buzzer. The TV shows the questions, players buzz from their phones, and one server decides who was first, corrected for each phone's latency. Rooms live in memory.

React · Express · Socket.IO · TypeScript 6 — buzzr.kimnejudne.dev

SKETCHY. A party drawing game. The drawer draws a secret word on their phone, the strokes stream live to the TV, everyone else guesses on theirs, and the server keeps the clock.

React · Express · Socket.IO · TypeScript 6 — sketchy.kimnejudne.dev

PokéTrack grew from an AI scaffold I rewrote; ts-dojo, Buzzr and Sketchy were built by AI coding agents against written specs, with the product calls mine. Each case study says how. Across all four: 60fps motion, prefers-reduced-motion honoured throughout, keyboard-navigable, and self-hosted on a single DigitalOcean droplet behind nginx.

Case studies at kimnejudne.dev/work · source at github.com/kim-nejudne

SKILLS

LANGUAGES	TypeScript · JavaScript · Python · SQL
FRONTEND	React · styled-components · Tailwind · SCSS · GSAP
BACKEND & DATA	NestJS · Express · Socket.IO · FastAPI · Postgres · MongoDB · Elasticsearch · WordPress / PHP
CRAFT	Accessibility (keyboard, semantics, reduced motion) · performance budgets · motion design · typography · real-time multiplayer · tests proven by sabotage
AUTOMATION & AI	n8n · Python scrapers · LLM integrations · spec-driven development with AI agents
INFRASTRUCTURE	Docker · nginx · Linux · CI/CD · Git

BACKGROUND

Nine years of production JavaScript, full-stack throughout: ERP modules, a storefront under real traffic, an MVP from empty schema to its first users. Before software, a decade of desktop publishing and magazine design, the part of this work that does not come from a framework.
